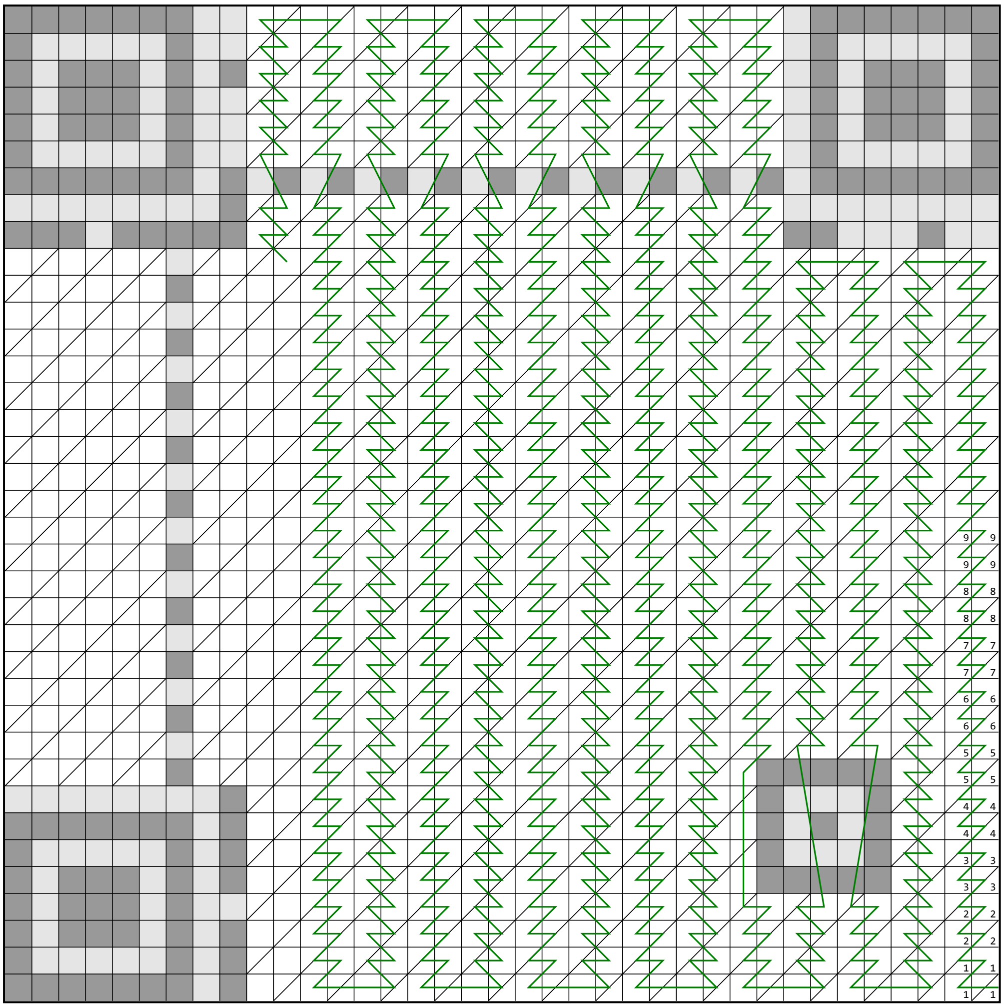
Worksheet for reading QR V5L0



> Step 1.

Color in the QR code modules. If a module contains only a diagonal line, color only the upper left half. Only color in modules that lie on the green line.

> Step 2.

For each (interleaved) data digit (4 consecutive bits along the green line), fill it inside the block table. Interpret squares with a diagonal line as inverted.

0 : 0000		8 : 1000	
1 : 0001		9 : 1001	
2 : 0010		A : 1010	
3 : 0011		B : 1011	
4 : 0100		C : 1100	
5 : 0101		D : 1101	
6 : 0110		E : 1110	
7 : 0111		F : 1111	

Data block (216 digits, 108 bytes)

1	2	3	4	5	6	7	8	9															

> Step 3.

Now, decode the data. Read the data block-by-block, essentially concatenating the blocks. The first digit indicates the encoding mode: 1 for numeric, 2 for alphanumeric, 4 for byte. If it's not byte, this tutorial will not work - sorry! The next two digits represent the number of characters to read. After, each two digits together form a number from 0 to 255, representing the ASCII values. It's easy to memorize: 31 (hex) is '1', 41 is 'A', 61 is 'a', 2E is '.', 2F is '/', and 3A is ':' (full table on page 7).
