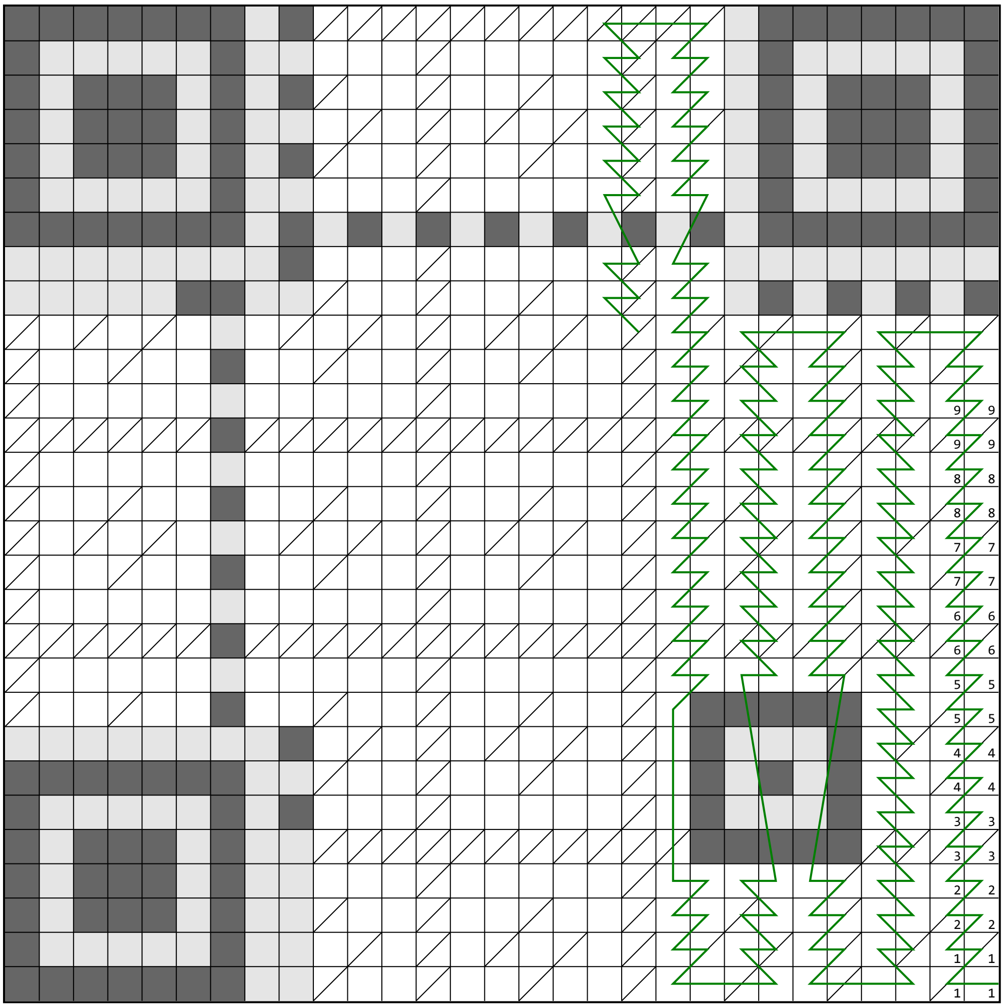
Worksheet for reading QR V3H5



> Step 1.

Color in the QR code modules. If a module contains only a diagonal line, color only the upper left half. Only color in modules that lie on the green line.

> Step 2.

For each (interleaved) data digit (4 consecutive bits along the green line), fill it inside the block table. Interpret squares with a diagonal line as inverted.

0	:	0000		8	:	1000
1	:	0001		9	:	1001
2	:	0010		A	:	1010
3	:	0011		B	:	1011
4	:	0100		C	:	1100
5	:	0101		D	:	1101
6	:	0110		E	:	1110
7	:	0111		F	:	1111

Data block 1 (26 digits, 13 bytes)

1	2	5	6	9																			

Data block 2 (26 digits, 13 bytes)

3	4	7	8																				

> Step 3.

Now, decode the data. Read the data block-by-block, essentially concatenating the blocks. The first digit indicates the encoding mode: `1` for numeric, `2` for alphanumeric, `4` for byte. If it's not byte, this tutorial will not work - sorry! The next two digits represent the number of characters to read. After, each two digits together form a number from 0 to 255, representing the ASCII values. It's easy to memorize: `31` (hex) is `'1'`, `41` is `'A'`, `61` is `'a'`, `2E` is `'.'`, `2F` is `'/'`, and `3A` is `':'` (full table on page 7).
