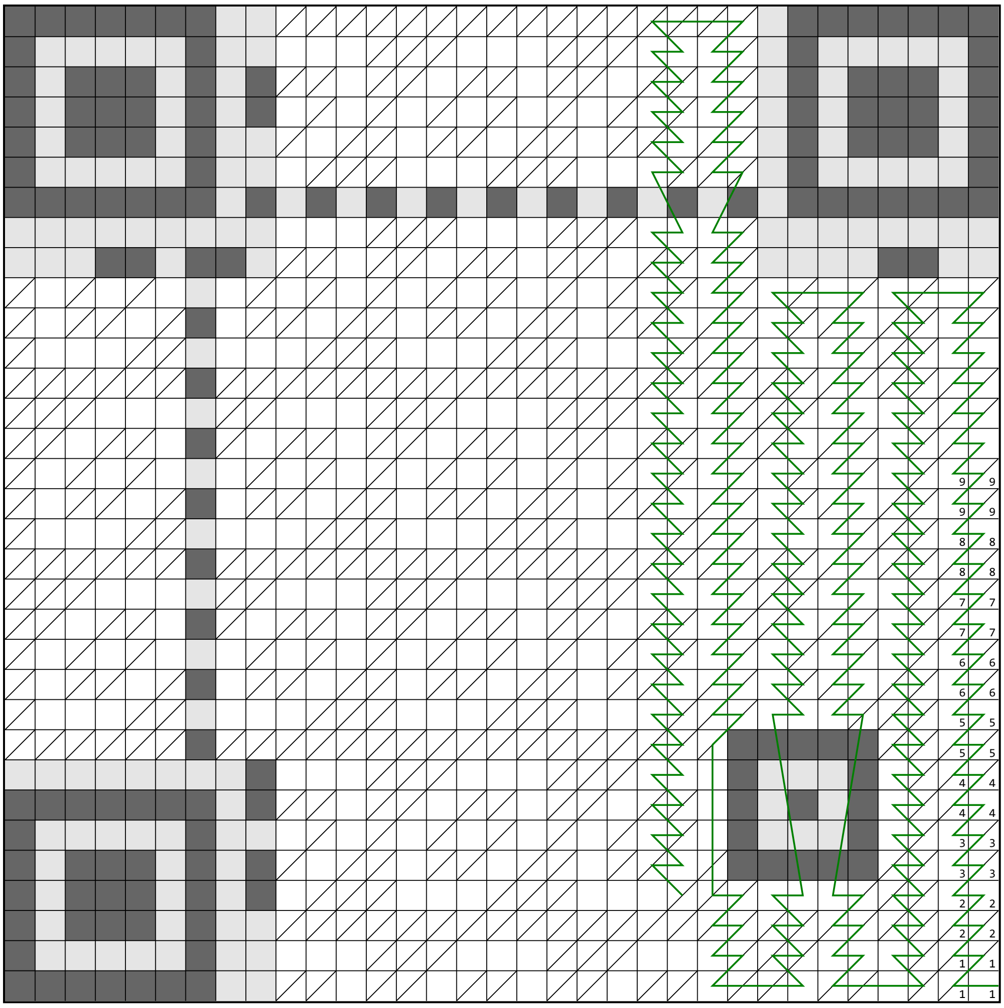
Worksheet for reading QR V4H6



> Step 1.

Color in the QR code modules. If a module contains only a diagonal line, color only the upper left half. Only color in modules that lie on the green line.

> Step 2.

For each (interleaved) data digit (4 consecutive bits along the green line), fill it inside the block table. Interpret squares with a diagonal line as inverted.

```
0 : 0000    8 : 1000
1 : 0001    9 : 1001
2 : 0010    A : 1010
3 : 0011    B : 1011
4 : 0100    C : 1100
5 : 0101    D : 1101
6 : 0110    E : 1110
7 : 0111    F : 1111
```

Data block 1 (18 digits, 9 bytes)

1	2	9															

Data block 2 (18 digits, 9 bytes)

3	4																

Data block 3 (18 digits, 9 bytes)

5	6																

Data block 4 (18 digits, 9 bytes)

7	8																

> Step 3.

Now, decode the data. Read the data block-by-block, essentially concatenating the blocks. The first digit indicates the encoding mode: `1` for numeric, `2` for alphanumeric, `4` for byte. If it's not byte, this tutorial will not work - sorry! The next two digits represent the number of characters to read. After, each two digits together form a number from 0 to 255, representing the ASCII values. It's easy to memorize: `31` (hex) is `'1'`, `41` is `'A'`, `61` is `'a'`, `2E` is `'.'`, `2F` is `'/'`, and `3A` is `':'` (full table on page 7).
