

Worksheet for reading QR V2Q6

> Step 1.

Color in the QR code modules. If a module contains only a diagonal line, color only the upper left half. Only color in modules that lie on the green line.

> Step 2.

For each (interleaved) data digit (4 consecutive bits along the green line), fill it inside the block table. Interpret squares with a diagonal line as inverted.

0 :	0000	8 :	1000
1 :	0001	9 :	1001
2 :	0010	A :	1010
3 :	0011	B :	1011
4 :	0100	C :	1100
5 :	0101	D :	1101
6 :	0110	E :	1110
7 :	0111	F :	1111

Data block (44 digits, 22 bytes)

[illegible]

> Step 3.

Now, decode the data. Read the data block-by-block, essentially concatenating the blocks. The first digit indicates the encoding mode: 1 for numeric, 2 for alphanumeric, 4 for byte. If it's not byte, this tutorial will not work - sorry! The next two digits represent the number of characters to read. After, each two digits together form a number from 0 to 255, representing the ASCII values. It's easy to memorize: 31 (hex) is '1', 41 is 'A', 61 is 'a', 2E is '.', 2F is '/', and 3A is ':' (full table on page 7).
