

Worksheet for reading QR V1H3

> Step 1.
Color in the QR code modules. If a module contains only a diagonal line, color only the upper left half. Only color in modules that lie on the **green** line.

> Step 2.
For each (interleaved) data digit (4 consecutive bits along the green line), fill it inside the block table. Interpret squares with a diagonal line as inverted.

0	: 0000	8	: 1000
1	: 0001	9	: 1001
2	: 0010	A	: 1010
3	: 0011	B	: 1011
4	: 0100	C	: 1100
5	: 0101	D	: 1101
6	: 0110	E	: 1110
7	: 0111	F	: 1111

Data block (18 digits, 9 bytes)

1	2	3	4	5	6	7	8	9									
---	---	---	---	---	---	---	---	---	--	--	--	--	--	--	--	--	--

> Step 3.
Now, decode the data. Read the data block-by-block, essentially concatenating the blocks. The first digit indicates the encoding mode: 1 for numeric, 2 for alphanumeric, 4 for byte. If it's not byte, this tutorial will not work - sorry! The next two digits represent the number of characters to read. After, each two digits together form a number from 0 to 255, representing the ASCII values. It's easy to memorize: 31 (hex) is '1', 41 is 'A', 61 is 'a', 2E is '.', 2F is '/', and 3A is ':' (full table on page 7).
